Goal: Find a list of changes for a JavaScript project that is quite popular, and he uses. He does this every week or so to see if there are any major changes that affect him.

Visit the homepage

list of changes this week

Browses through the

Sees a major project that he uses - Prisma has released a change

Observes that the changes is listed as minor — but branded as major or breaking

Takes a look at the changes as it probably affects him

Reddit has a format which might be good to look at for inspiration

Sorting purely on time or some sort of user "up-voting"?

How is the changed identified?

Was this labeling done by users or the site itself?

This is really needed

There should probably an export option, in case he wants to share this with others

List of projects with changes for each

He visits the site

every week, we can

ask him to save

cookies so we can

remember which list

he clicks on

Maybe we could just show a list of releases and the version change

Can users comment on changes?

because Prisma tends to release breaking changes and mark them as "minor" by SemVer

This should be

clearly indicated

visually

Do we do any special formatting to the release notes or just render the markdown directly?

Should we allow anonymous commenting?

Should we allow

anonymous voting?

Goal: Make a new custom release feed.

Visit the homepage

It should be obvious that users **can** create new custom release feeds

The user will have to have an account and be logged in to create a release feed

Maybe users can choose to make their release feeds public so they can view anonymously? Begins the process of creating a new release feed

This can be down by searching for projects on GitHub and adding them

Might also want to support adding from package files like package.json Selects a name for the feed

Maybe this can be automatically selected based on the content? If the user doesn't want to choose one.

Selects the items to go into the release feed

They should be able to immediately tell if the project is correct

We can use the GitHub description field for the project here to help describe the project

The feed should save automatically each time it is modified.
